

Gestió de Projectes en R (1) amb git i renv

Curs R Avançat Equips - Sessió 2

- Gestió de Projectes en R (1) amb git i renv
- Avui
- 1. Apunts Feina reproduïble amb R i renv
- 2. Introduction - the problems (i)
 - 2.1. The problems (ii)
 - 2.2. The problems (iii)
 - 2.3. The problems (iv)
 - 2.4. The problem (v)
 - 2.5. The problem (vi)
- 3. Enemies of reproducibility & adaptability
- 4. Reproducibility & Adaptability
- 5. Reproducibility & Adaptability - Example in Posit Cloud
 - 5.1. Level 1: Virtual Machines or Containers
 - 5.2. Level 2: RStudio-Posit Workbench
 - 5.3. Level 3: renv - for packages
 - 5.4. Level 4: git - for code
- 6. More information
- 7. Hands-on (guided) practical exercise
 - 7.1. Register a free account at Posit Cloud
 - 7.2. Create a Project from git repository
 - 7.3. Choose R 3.6.x & Run Rmd
 - 7.4. Choose R 4.2.x & Run Rmd again
 - 7.5. Choose R 3.4.x & Run Rmd
 - 7.6. Additional info
- 8. Exercici (no guiat) amb renv

Avui

- El dia passat vam introduir-nos a **git** (i Gitlab com a eina, i núvol remot)
- Avui:
 1. enllestirem feines pendents i adquirirem els conceptes nous següents:
 - Afegir nom i correu-e a la instal.lació git de l'ordinador local (així ens quedarà benvingut/a i el sistema atribuirà l'autoria de cada **commit** personal de cadascú)
 - ens crearem un parell de claus ssh (la privada i la pública) des del propi **RStudio > Tools > Global Options > Git/SVN > SSH Key > Create SSH Key**
 - deixarem una còpia de la nostra clau pública SSH (individual del nostre usuari i

màquina) en el nostre compte a gitlab.com.

Així ja podrem clonar repositoris i fer push de commits sense haver de posar cap contrasenya cada vegada.

2. Ens introduirem al control de versions de paquets d'R emprats en un projecte: [renv](#)

1. Apunts Feina reproduïble amb R i renv

The screenshot shows the Posit Cloud interface in Mozilla Firefox. On the left, there's a sidebar with links for Spaces, Learn, Help, and Info. The main area shows a workspace titled "Your Workspace / datascience2023". In the center, there's a code editor window with an R script titled "ReproducibleWork_HandsOnExercise....". The script contains R code for reading data from a CSV file and creating a tibble. Below the code editor is a preview of the resulting tibble data. To the right of the code editor is a file browser showing files like .gitignore, .Rhistory, .Rprofile, project.Rproj, README.md, recipes, renv, and renv.lock. At the bottom, there's a terminal window showing system information for an AWS instance. A dropdown menu for R version selection is open, showing options from 4.2.2 down to 3.4.4, with 4.2.2 selected.

2. Introduction - the problems (i)

Challenge to scientists: does your ten-year-old code still run?

Missing documentation and obsolete environments force participants in the Ten Years Reproducibility Challenge to get creative.

Jeffrey M. Perkel

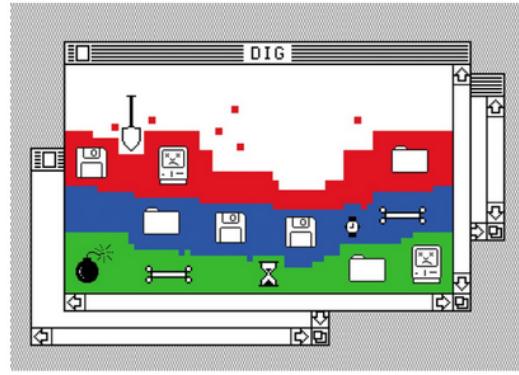

Illustration by The Project Twins

Perkel, J. (2020). Challenge to scientists: does your ten-year-old code still run? *Nature*. <https://www.nature.com/articles/d41586-020-02462-7>

Obsolete Devices storing code & data

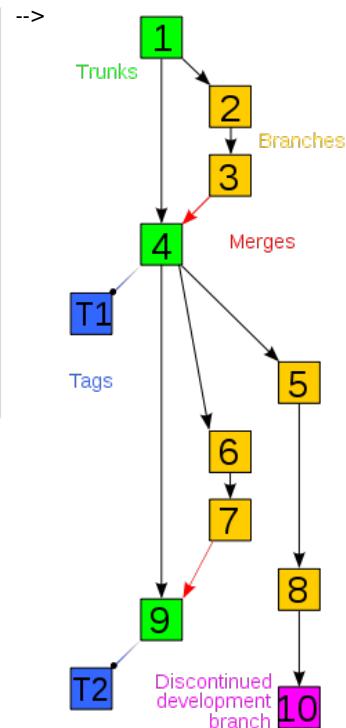

--> Ease copying to new devices (legally also: copyleft, ...) + online repositories

From <https://www.shutterstock.com/image-illustration/3d-illustration-evolution-storage-devices-1420443290>

2.1. The problems (ii)

Software obsolescence and incompatible dependency versions

--> Adapt to code evolution:

- Controlling Package Versions ([renv](#))
- VCS ([git](#), bazaar, svn...)

VCS = Version Control Systems

2.2. The problems (iii)

THE #1 PROGRAMMER EXCUSE FOR LEGITIMATELY SLACKING OFF:
"The Subversion server's down"

-->

Central Repository

User A User B User C

commit
checkout
update

CVCS

Decentralization

Central Repo.

User A User B User C

pull
commit
diff

DVCS

Centralization (such as **Subversion VCS (svn)**) may increase efficiency but --> From Centralized VCS (such as **svn**) to Decentralized VCS (such as **git**) it also **decreases Resilience** ("shit happens")

VCS = Version Control Systems

2.3. The problems (iv)

X

GLOBALLY INSTALLED PACKAGES

ACTIVATE ENVIRONMENT 1

install serpapi = 1.05

PROJECT 2

ACTIVATE ENVIRONMENT 2

install serpapi = 1.08

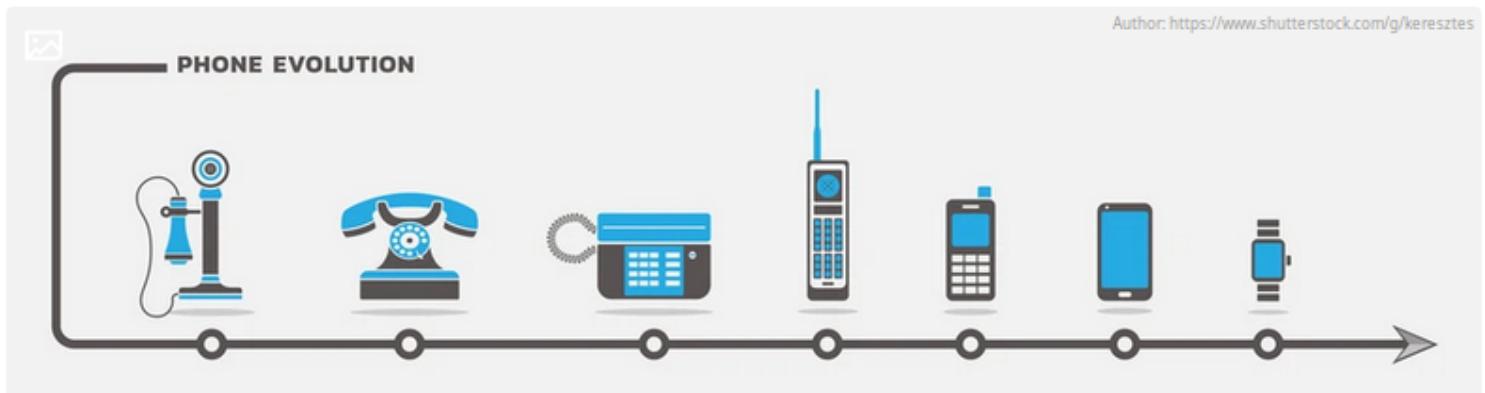

serpapi 1.08

ENVIRONMENT PACKAGES

Conflicting package versions at system level with package versions at project levels

--> Package versions per project Environment (**renv**)

2.4. The problem (v)

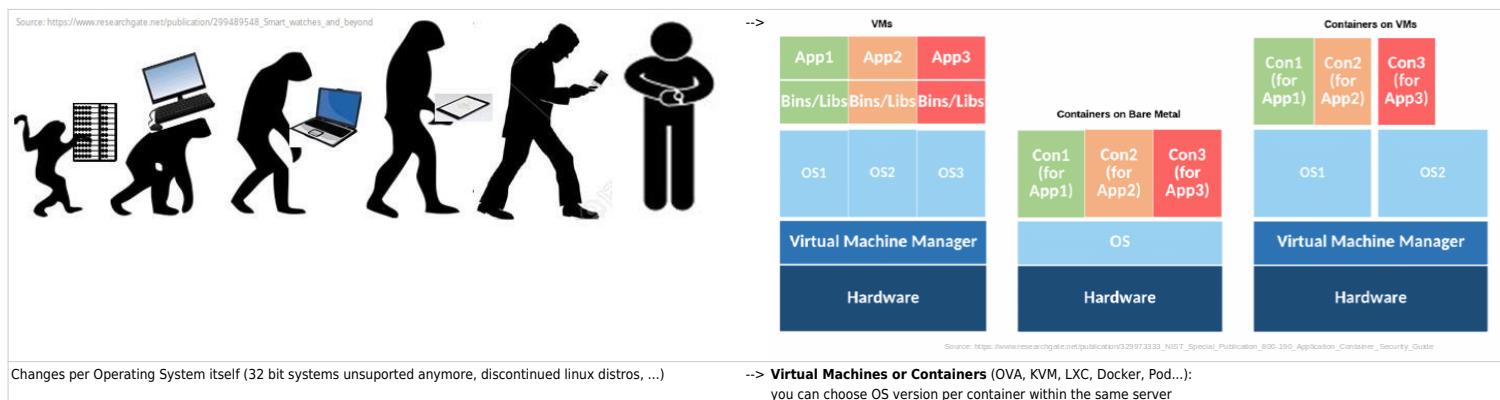

Sometimes a project was developed with a major version of a programming language (R 3.x, Python 2.x), while another project in the same server requires a different major version (R 4.x, Python 3.x)

--> **R case:** from [RStudio Server](#) to [Posit Workbench](#) (former *RStudio Server Pro*)

You can choose R version per project

Python: Several approaches (conda, PyCharm, ...): see this as an example^[1].

2.5. The problem (vi)

3. Enemies of reproducibility & adaptability

Enemies of reproducibility and adaptability (in levels): Changes / Evolution / Versions!

1. **Operating system** and its **dependencies** (and their versions)
2. **Programming language** (and its version)
3. **Specific Packages** (and versions) as dependencies for your Work Project
4. **Versions** of your **own code** (algorythm and param variations, etc): lacking versioning system
5. **Readability and tidyness** of your own code / routines / scripts
6. Lack of **documentation/help resources** + steep learning curve to use it or adapt it to your context or infrastructure

4. Reproducibility & Adaptability

How to avoid reproducibility & adaptability enemies (in R & Python for Data Science):

<u>ISSUES</u>	<u>SOLUTIONS / WORKAROUNDS</u>
(Level 1) Versions in OS repos & critical dependencies: curl, ssl, GDAL, Java, cpp, V8...	Virtual Machines or <u>Containers</u> (VBox, KVM, LXC, Docker, Pod...)
(Level 2) Versions in Programming language: Python 2.x vs 3.x, R 3.x vs 4.x, ...	Python: Conda, Google Colab, ... R: <u>RStudio/Posit Workbench</u> General (in Linux clusters): <i>software modules</i> .
(Level 3) Versions in Specific packages	==== Py: <u>.env</u> , <u>poetry</u> R: <u>Packrat</u> , <u>Renv</u> (by versions), <u>MRAN</u> (by date)
(Level 4) Versions in Your own scripts	Decentralized VCS: <u>Git</u> (Gitlab, Github, ...), <u>Bazaar</u> (Launchpad), ... Centralized VCS: CVS, SVN (Sourceforge, ...), ... <i>VCS = Version Control system</i>
(Level 5) Tidy script content and organization	<u>Literate Coding</u> (Scripting & Coding) / Analysis - R : <u>Rstudio Notebooks</u> with modern R (<i>Tidyverse</i>). VS Notebooks, G-Colab, ... - Python : <u>Jupyter Notebooks</u> , Rstudio Notebooks, VS Notebooks, G-Colab, ... (<u>Quarto</u> Markdown and rendering for both and more)
(Level 6) Help to lower the learning curve	Documentation, Code Vignettes, Examples, Tutorials, Learning material (<u>learnr</u>), Books (<u>bookdown</u>)...

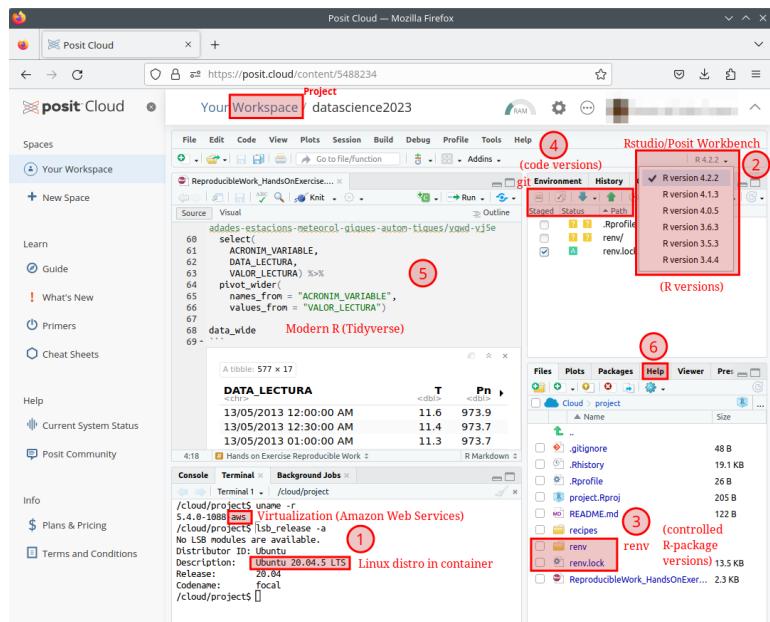

5. Reproducibility & Adaptability - Example in Posit Cloud

Example in <https://posit.cloud>^[2] (former *RStudio Server Pro*) :

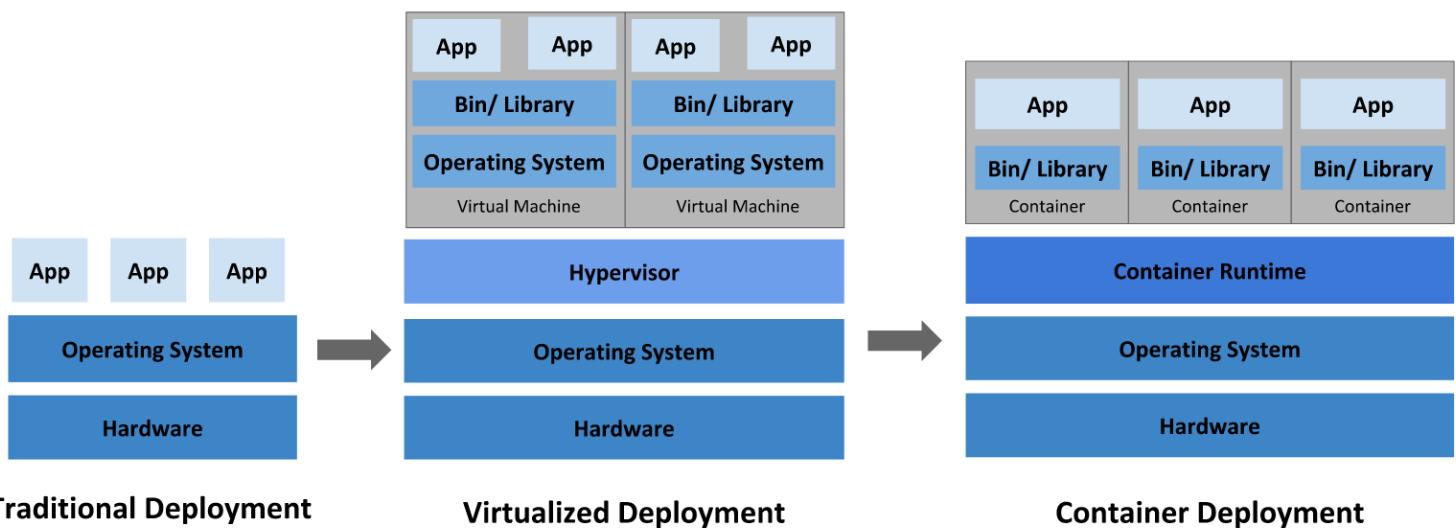

- Level 1: A **Container** with a specific linux distro (e.g. Ubuntu Linux 20.04 Focal LTS) per project.
- Level 2: **RStudio/Posit Workbench** (which allows choosing R version per project)
- Level 3: renv for your R package collection (and

specific versions) in your project

- Level 4: git or svn for your scripts in your project
- Level 5: YOU (*Tidyverse* is your friend)
- Level 6: YOU (+ helpers: `roxygen2`, `blogdown`, `learnr`, `bookdown`, ...)

5.1. Level 1: Virtual Machines or Containers

From:

<https://kubernetes.io/docs/concepts/overview/>^[3]

5.2. Level 2: RStudio-Posit Workbench

R version 4.2.2 (2022-10-31) -- "Innocent and Trusting"
 Copyright (C) 2022 The R Foundation for Statistical Computing
 Platform: x86_64-pc-linux-gnu (64-bit)

R is free software and comes with ABSOLUTELY NO WARRANTY.
 You are welcome to redistribute it under certain conditions.
 Type 'license()' or 'licence()' for distribution details.

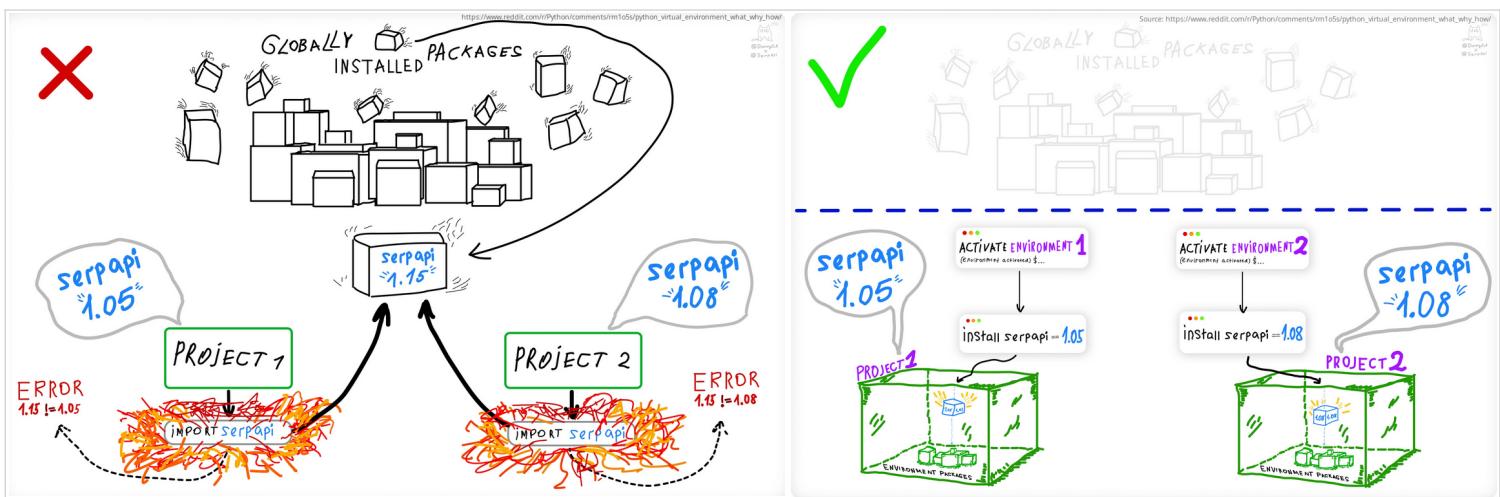

R is a collaborative project with many contributors.
 Type 'contributors()' for more information and
 'citation()' on how to cite R or R packages in publications.

Type 'demo()' for some demos, 'help()' for on-line help, or
 'help.start()' for an HTML browser interface to help.
 Type 'q()' to quit R.

Connected to your session in progress, last started 2023-Feb-15 23:48:56 UTC (5 minutes ago)

5.3. Level 3: renv - for packages

Version control in work "environments"

5.3.1. Virtual environments in R with renv

renv

Overview

The `renv` package helps you create **reproducible environments** for your R projects. Use `renv` to make your R projects more:

Isolated: Installing a new or updated package for one project won't break your other projects, and vice versa. That's because `renv` gives each project its own private package library.

Portable: Easily transport your projects from one computer to another, even across different platforms. `renv` makes it easy to install the packages your project depends on.

Reproducible: `renv` records the exact package versions you depend on, and ensures those exact versions are the ones that get installed wherever you go.

Installation

Install the latest version of `renv` from CRAN with:

```
install.packages("renv")
```

5.3.3. "Happy path"

For a reproducible environment

Commands in terminal - Computer 1

```
cd project_folder
git init
R
[obrir proyecto de RStudio]
renv::init() # to initialize renv in
your code project
renv::snapshot() # to make a
snapshot "picture" of the list of R
packages used within the whole R
project and their respective package
versions
q()
git commit ...
git push
```

Commands in terminal - Computer 2

```
cd project_folder
git clone/git pull ...
R
[open same RStudio project]
renv::status() # for a report on
which steps are suggested for you to
follow
renv::restore() # to restore the
package library (with the required
pacckage versions) for this project
[continue working in/developing your
code]
renv::snapshot() # to make a new
snapshot "picture" (in case there
are new packages and/or versions or
R packages newer or older in use in
your project ;-)
q()
git commit ...
```

5.3.4. Infrastructure

Projects with `renv` write and use these files in order to work:

File	Use
<code>.Rprofile</code>	Used to activate <code>renv</code> for new R sessions launched in the project.
<code>renv.lock</code>	The lockfile, describing the state of your project's library at some point in time.
<code>renv/activate.R</code>	The activation script run by the project <code>.Rprofile</code> .
<code>renv/library</code>	The private project library.
<code>renv/settings.dcf</code>	Project settings – see <code>?settings</code> for more details.

By default, `renv` uses a package memory-cache here:

Platform	Location
Linux	<code>~/.local/share/renv</code>
macOS	<code>~/Library/Application Support/renv</code>
Windows	<code>%LOCALAPPDATA%/renv</code>

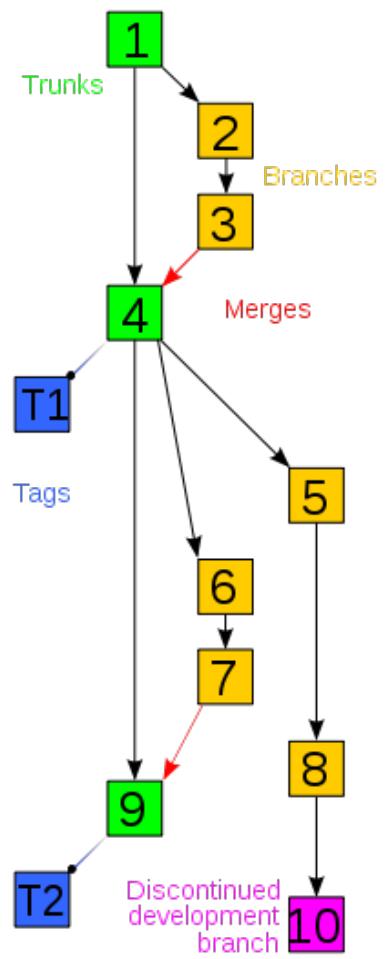

5.3.5. Advanced use

```
renv::install("packagename", version="0.1") # to install old versions from a
package (useful also for discontinued packages in CRAN!). See possible package-
version numbers at https://cran.r-project.org/src/contrib/Archive/yourpackage/
renv::record("packagename", version="0.1") # to save at renv.lock the specific
version you need for this package
renv::deactivate() # to temporarily deactivate renv in your project
renv::activate() # to reactivate renv in your project
renv::equip() # for special installations in MS Windows
vignette("docker", package = "renv") # for a commbined use with Docker
vignette("collaborating", package = "renv") # to improve collaborative use in work
teams
```

And much more. See:

- [https://rstudio.github.io/renv/articles/renv.html^{\[4\]}](https://rstudio.github.io/renv/articles/renv.html)
- [https://solutions.posit.co/envs-pkgs/environments/^{\[5\]}](https://solutions.posit.co/envs-pkgs/environments/)

7. Hands-on (guided) practical exercise

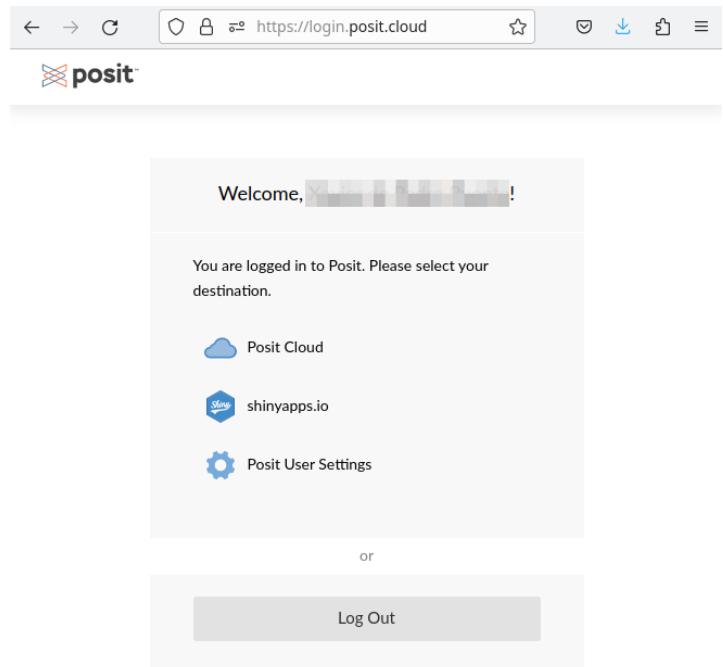

7.1. Register a free account at Posit Cloud

You can do so at:

- <https://posit.cloud/plans/free>^[24]

You will need to click on a link sent to your email inbox to validate your account.

Once done, you'll see something like:

7.2. Create a Project from git repository

Enter Posit cloud and click at **New Project > New Project from Git Repository**

The screenshot shows the Posit Content page. On the left, there's a sidebar with "Your Workspace" (Xavier de Pedro Puente), "Content" (selected), "Usage", and "About". The main area is titled "Your Content (1)". It shows a project named "My First Test" with details: "RStudio Project", "Private", and "Created Feb 25, 2023 1:11 PM". To the right, there's a "New Project" dropdown menu with options: "New RStudio Project", "New Jupyter Project", and "New Project from Git Repository", which is highlighted with a red box.

7.2.1. Visit gitlab to get clone url

Visit this code project in gitlab to get the project clone url:
<https://gitlab.com/xavidp/datascience2023>^[25]

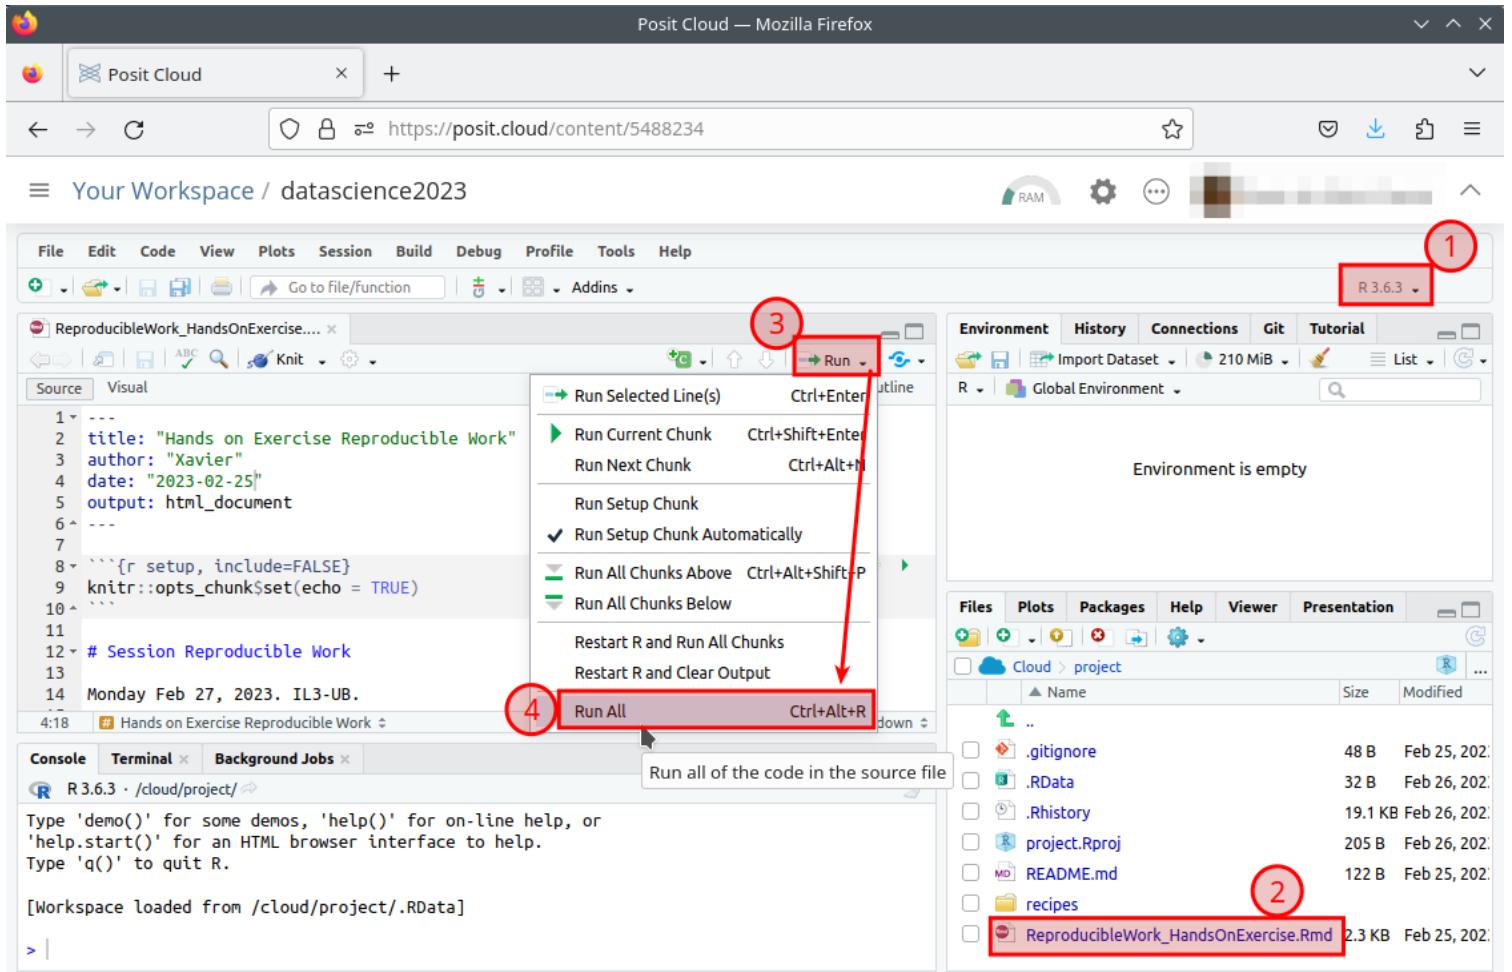

The screenshot shows a GitLab project page for 'DataScience2023'. The URL in the browser bar is <https://gitlab.com/xavidp/datasience2023>. The project summary indicates 5 Commits, 1 Branch, 0 Tags, and 236 KB Project Storage. The description states: 'Extra files and git repository for my sessions held at the DataScience Postgraduate Course at IL3-UB - 2023'. A file named 'Base Rmd file' by Xavier de Pedro was authored 9 minutes ago. On the right, there are buttons for 'Clone' (highlighted with a red box), 'Clone with SSH' (with the URL 'git@gitlab.com:xavidp/datascien'), 'Clone with HTTPS' (with the URL 'https://gitlab.com/xavidp/datascience2023'), and 'Open in your IDE' (with options for Visual Studio Code (SSH), Visual Studio Code (HTTPS), IntelliJ IDEA (SSH), and IntelliJ IDEA (HTTPS)).

7.2.2. Create project from git repo

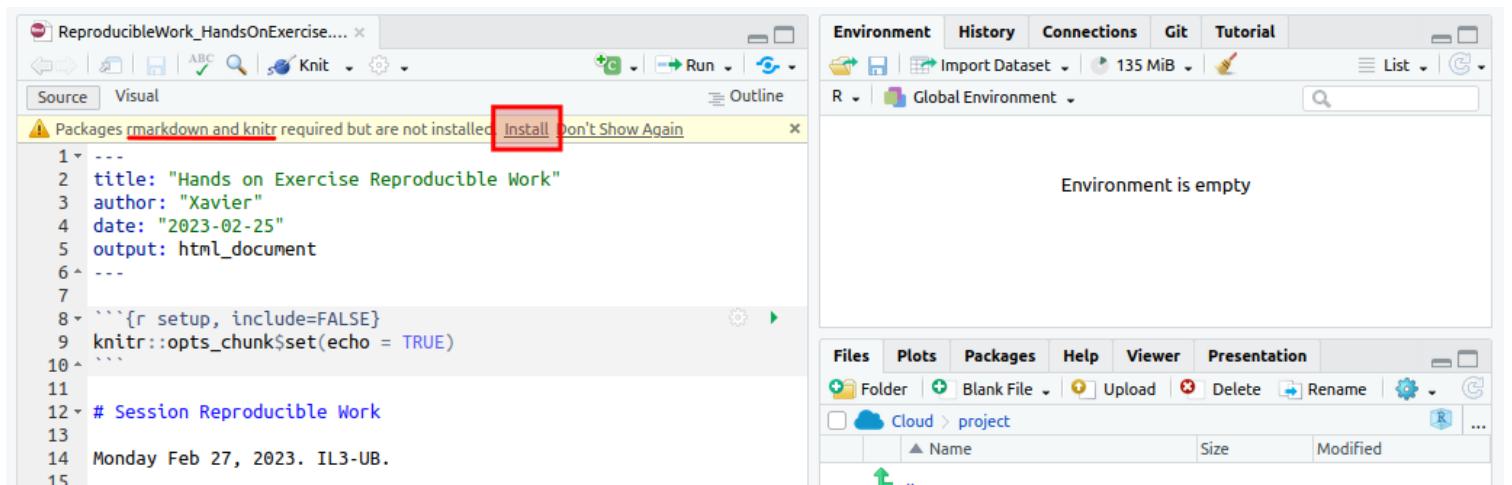

Paste it in the Posit cloud popup window and click at OK:

The screenshot shows the 'New Project from Git Repository' dialog in the Posit cloud interface. The URL of the Git Repository is pasted into the input field: <https://gitlab.com/xavidp/datasience2023.git>. The 'OK' button is visible at the bottom of the dialog.

7.3. Choose R 3.6.x & Run Rmd

7.3.1. Install dependencies also

```

11
12 # Session Reproducible Work
13
14 Monday Feb 27, 2023. IL3-UB.
15
16 Related to:
17 https://seeds4c.org/reproduciblework2023
18
19 # Hands on Exercise Reproducible Work
20 R Markdown

```

Console Terminal x Background Jobs x

Install R packages 0:05

```

* DONE (base64enc)
* installing *binary* package 'mime' ...
* DONE (mime)
* installing *binary* package 'ellipsis' ...
* DONE (ellipsis)
* installing *binary* package 'cachem' ...
* DONE (cachem)

```

7.3.2. Running Rmd will perform GNU/Linux system commands also

GNU/Linux system commands will usually be much more efficient in memory & cpu

It helps to prevent RAM bottlenecks with just 1Gb RAM on Posit Cloud Free plan

(while csv file from reduced meteorological dataset is already 0.5 Gb).

The screenshot shows the RStudio interface with the following details:

- Source Editor:** Displays R code for downloading and decompressing a CSV file named "data_smc.csv". The code uses `system("wget")` to download the file and `system("bunzip2")` to decompress it into "data_subset.csv".
- Console:** Shows the command `> data <- read_csv("data_subset.csv")` and its output: "Rows: 1000000 Columns: 8 — Column specification".
- File Explorer:** Shows the project directory structure:
 - Cloud > project
 - .gitignore (48 B)
 - .Rhistory (0 B)
 - data_smc.csv.bz2** (50.2 MB) - highlighted with a red box.
 - project.Rproj (205 B)
 - README.md (122 B)
 - ReproducibleWork_HandsOnExer... (629 B)
 - data_smc.csv** (613.3 MB) - highlighted with a red box.
 - data_subset.csv** (61.3 MB) - highlighted with a red box.

7.3.3. Display raw data

Variables are in numeric codes (not easily readable by humans in a semantic way). We lack some variable names (or acronyms at least) for readability.

The screenshot shows the RStudio interface. On the left is a data grid titled "data" containing 13 rows of data with columns: ID, CODI_ESTACIO, CODI_VARIABLE, DATA_LECTURA, and DATA_EXTREM. The data includes various station codes (XK, XL) and dates/times. On the right, the "Environment" pane shows a variable "data" with the value "1000000". Below it are sections for "Data", "Files", "Plots", and "Packs".

ID	CODI_ESTACIO	CODI_VARIABLE	DATA_LECTURA	DATA_EXTREM
1	XK721205132330	XK	72	12/05/2013 11:30:00 PM
2	XK361205132330	XK	36	12/05/2013 11:30:00 PM
3	XK381205132330	XK	38	12/05/2013 11:30:00 PM
4	XK321205132330	XK	32	12/05/2013 11:30:00 PM
5	XK401205132330	XK	40	12/05/2013 11:30:00 PM
6	XK421205132330	XK	42	12/05/2013 11:30:00 PM
7	XK331205132330	XK	33	12/05/2013 11:30:00 PM

7.3.4. Transform in tidy way (i)

The screenshot shows RStudio with a code editor and a data viewer.

```

34
35 `'{r}
36 # Get the description of the variable codes
37 # From here: https://analisi.transparenciacatalunya.cat/Medi-Ambient/Metadades-variables-meteorol-giques/4fb2-n3yi/data
38 variables <- read_csv("https://analisi.transparenciacatalunya.cat/api/views/4fb2-n3yi/rows.csv?accessType=DOWNLOAD&sorting=true")
39 ```

Rows: 26 Columns: 6 — Column specification
  Delimiter: ","
  chr (4): NOM_VARIABLE, UNITAT, ACRONIM, CODI_TIPUS_VAR
  dbl (2): CODI_VARIABLE, DECIMALS
  i Use `spec()` to retrieve the full column specification for this data.
  i Specify the column types or set `show_col_types = FALSE` to quiet this message.

40
41 `'{r}
42 # We prepare a small dataframe from the variable definition to join on the smc data frame
43 variables.to.join <- variables %>%
44   select(CODI_VARIABLE, ACRONIM) %>%
45   arrange(CODI_VARIABLE)
46
47 variables.to.join
48 ```

A tibble: 26 × 2
  CODI_VARIABLE ACRONIM
  <dbl> <chr>
    1 Px
    2 Pn
    3 HRx
    4 VV10
    5 VV11
    6 VV12
    7 VV13
    8 VV14
    9 VV15
    10 VV16
    11 VV17
    12 VV18
    13 VV19
    14 VV20
    15 VV21
    16 VV22
    17 VV23
    18 VV24
    19 VV25
    20 VV26
    21 VV27
    22 VV28
    23 VV29
    24 VV30
    25 VV31
    26 VV32

```

The code reads a CSV file from a URL and creates a tibble named "variables.to.join" with two columns: "CODI_VARIABLE" and "ACRONIM". The tibble contains 26 rows of data.

7.3.5. Transform in tidy way (ii) - result

```

49
50  ````{r}
51  # Let's join variable df on to the data df
52  data <- left_join(data, variables.to.join) %>%
53    rename(ACRONIM_VARIABLE = ACRONIM)
54 ````

  Joining, by = "CODI_VARIABLE"

55
56  ````{r}
57  # Let's convert the source data frame (which is long shapè, as database) into a wide shape (table like, with meteorological variables as
columns) while selecting just one meteorological station as an example
58  data_wide <- data %>%
59    filter(CODI_ESTACIO == "D5") %>% # D5 corresponds to "Barcelona Observatori Fabra" Meteorological Observatory (at Collserola Mountain)
https://analisi.transparenciacatalunya.cat/Medi-Ambient/Metadades-estacions-meteorol-giques-autom-tiques/vawd-vj5e
60    select(
61      ACRONIM_VARIABLE,
62      DATA_LECTURA,
63      VALOR_LECTURA) %>%
64    pivot_wider(
65      names_from = "ACRONIM_VARIABLE",
66      values_from = "VALOR_LECTURA")
67
68 data_wide
69 ````

```

7.3.6. Last code chunks

```

70
71  ````{r}
72  # Save resulting dataset to disk
73  write_csv(data_wide, "data_subset_d5_wide.csv")
74 ````

75
76
77  ````{r}
78  # Produce a simple R version of this R Markdown document
79  knitr:::purl("ReproducibleWork_HandsOnExercise.Rmd", documentation=2)
80 ````

  [1] "ReproducibleWork_HandsOnExercise.R"

81
82
4:18  # Hands on Exercise Reproducible Work

```

7.4. Choose R 4.2.x & Run Rmd again

Repeat the previous steps but in a R 4.2.x environment: install dependent R packages again... (new environment, but still installing from CRAN repos). renv not needed in this case still (lucky you!).

So far, so good.

7.5. Choose R 3.4.x & Run Rmd

Now let's touch some issues with R package versions in a R 3.4.x environment

Running Rmd will fail at some package installations

- `dplyr` installation fails
- `readr` is reported as unavailable in R 3.4.4
- `tidyverse` installation also fails (as well as `purrr`)

Solution

In this case, the solution involves finding some valid previous package version for each conflicting R package, and using this type of commands:

- `renv::init()`
- `renv::install("packagename@x.y.z")` # being x.y.z a valid package version number, as taken from <https://cran.r-project.org/src/contrib/Archive/packagename/>^[26]
- `renv::record("packagename@x.y.z")`
- `renv::snapshot()` # after all packages installed without any more issues

```

Console Terminal × Background Jobs ×
R 3 · /cloud/project/
> renv::init()

* Initializing project ...
* Discovering package dependencies ... Done!
* Copying packages into the cache ... Done!
The following package(s) will be updated in the lockfile:

# RSPM =====
- R6          [* -> 2.5.1]
- base64enc   [* -> 0.1-3]

```

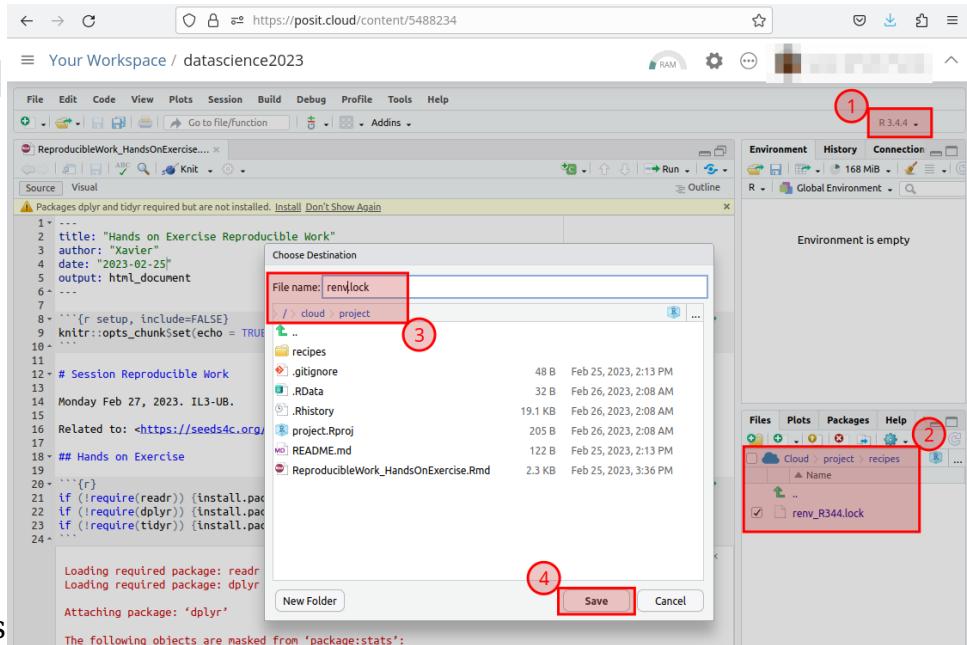

7.5.1. Use `renv.lock` recipe (i)

Let's get `renv` to the rescue.
Once somebody solved these issues, and found a valid recipe of package versions for this environment, a file `./renv.lock` will have been produced in the project root

folder after running the command `renv::snapshot()`

I did this already, and I uploaded the produced **renv.lock** file to the manually created **./recipes/** folder in this project as a backup for you (as **renv_R344.lock**).

You can then copy now the **./recipes/renv_R344.lock** file provided in the project as **.renv.lock** in the project root folder, for **renv** to be able use it.

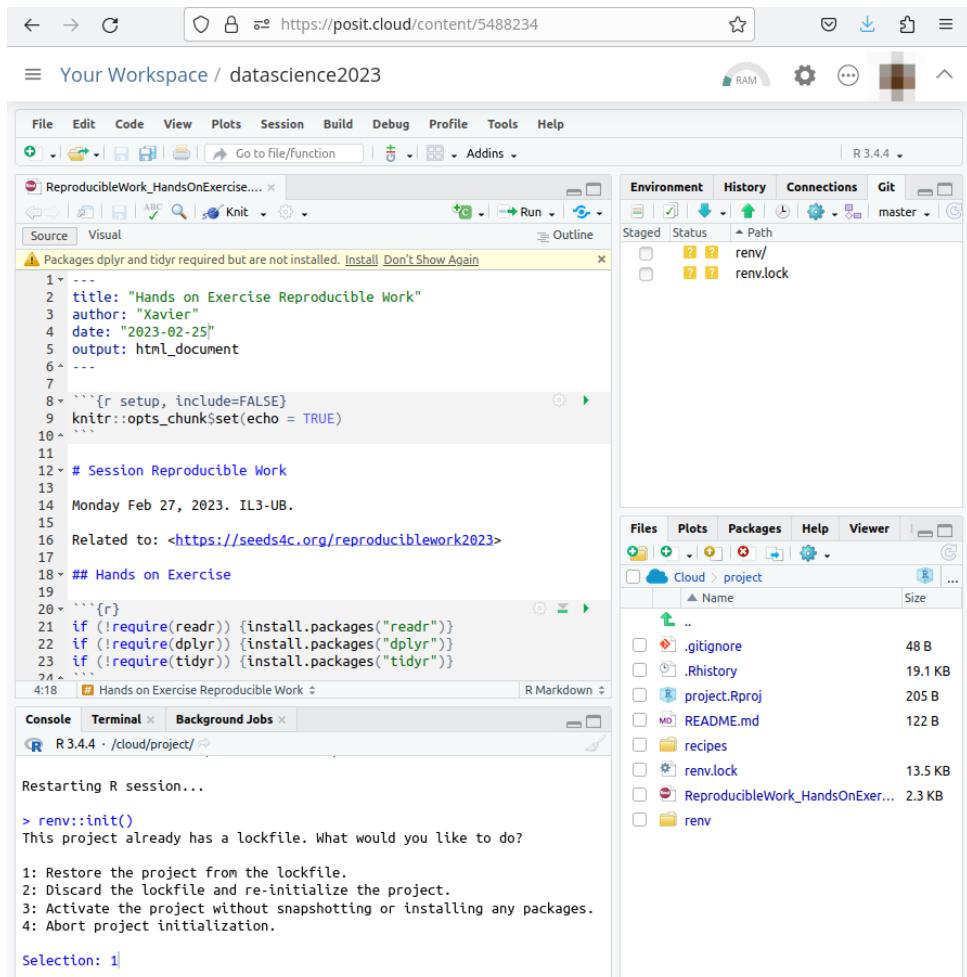

7.5.2. Use renv.lock recipe (ii)

Run `renv::init()` in the R console.

Choose restore the renv.lock package versions:

1. Restore the project from the lockfile

7.5.3. Use renv.lock recipe (iii)

You will be ready to go with minimum human intervention.

All R packages will be installed in the background to their required package versions, following the recipe that someone created for R 3.4.4. already.

The key file is the **renv.lock** file.

The screenshot shows the RStudio interface with the following details:

- Source View:** Displays the R Markdown code for a document named "ReproducibleWork_HandsOnExercise....". It includes a warning message about required packages dplyr and tidyr not being installed.
- Console View:** Shows the output of the R session, indicating the installation of tinytex, rmarkdown, and tidyverse packages from the renv.lock file.
- File Explorer:** Shows the project structure with files like .gitignore, .Rhistory, project.Rproj, README.md, recipes, renv.lock, ReproducibleWork_HandsOnExercise...., renv, and .Rprofile.
- Git Panel:** Shows the current branch is master, with renv/ and renv.lock staged.

7.5.4. Use renv.lock recipe (iv) - finished

Resume

8. Exercici (no guiat) amb renv

- Exemple recuperació de dades de forma fàcil amb projecte antic emprant tabulaR i renv:
 - Taula pdf de centres
https://economia.gencat.cat/web/.content/70_joc_apostes/m_ambit/salons/documents/SALONS-DE-JOC-EN-LA-WEB_31122022.pdf^[27]
- Farem l'exercici en local (no en posit cloud)
 - Descarregar exercici, via git (repo dels apunts), i intentar executar aquest arxiu Rmd:
https://gitlab.com/radup/curs-r-avancat-equips/-/blob/main/sessio_02/Sessio_02_Exercici_Llista_Centres_Joc.Rmd^[28]
- Resoleu vosaltres els problemes per poder tenir l'entorn de treball necessari per executar l'script.
- Si algun paquet no l'aconseguiu instal.lar, podeu mirar (o emprar sencer) el contingut de l'arxiu [renv_R432.lock](#) que hi ha dins el projecte.

SORT! :-)
